

# ST-SS304-197-50

The advantage of the strap clamping system is the stainless steel strap made of high-quality stainless steel with a thickness of 19mm. The stainless steel strap allows anchoring to any large diameter, round, square or multi-profile profiles. The stainless steel straps are supplied in a practical plastic package of 50m.

The stainless steel strap for the stainless steel strap system is used in practice for attaching labels, cables, electrical boxes, cable and traction lines, support brackets, to columns, etc.

Furthermore, it is possible to use the stainless steel strap to assemble traffic and information signs, advertising boards and banners, attach hose ends to low-pressure and medium-pressure hoses, assemble telecommunications and security elements.

Stainless steel SS304 is generally preferred over stainless steel SS201 due to its excellent corrosion resistance, especially in harsher environments. SS304 stainless steel contains a higher percentage of both chromium and nickel, which results in better resistance to rust and oxidation. While SS201 stainless steel is more affordable and may be stronger in some cases, it is less resistant to corrosion and may be more prone to rusting, especially in salty or acidic environments.
